

BEYOND[®] CROP PRODUCTION SYSTEM

AGSECO and BASF have teamed-up to bring the CLEARFIELD[®] Production System to wheat farmers in Kansas, Oklahoma, Colorado, and Nebraska. This system combines superior genetics, such as the variety Protection, with excellent weed control through Beyond[™] herbicide.

This combination of AGSECO wheat varieties and BASF technology provides wheat farmers another management tool in their efforts to maximize grain yields and profit.

Beyond[™] herbicide will control or suppress a broad spectrum of weeds, many of which have been previously uncontrollable in wheat production. Difficult weeds such as:

- jointed goatgrass
- cheatgrass
- downy brome
- hairy chess
- feral rye
- volunteer cereals
- Italian ryegrass

CLEARFIELD[®] wheat varieties are developed using conventional methods and there are no marketing or export restrictions attached to these varieties.

AGSECO is currently evaluating many new CLEARFIELD[®] wheat lines and expects to have widely adapted varieties in the near future.
